Carl Sutton,
Dario has written a new post in the thread Column means example in lecture on the Week 2 Lectures forum for the R Programming online course.

You should write something of the form:

```
mymean <- columnmean(airquality)
mymean
```

Thus you assign to the variable "mymean" (which name might as well even have been "means", as the variable used inside the function) the value returned by your function, and then print it on screen.
I hope I've been clear enough. ^^
